Current \$317.36 | +36.3% upside

- 68% EBIT margin
- 11% revenue CAGR
- \$13T+ annual payment volume
- 257B transactions processed

INVESTMENT RECOMMENDATION / THESIS

Visa Inc. is rated a **Buy** with a 12-month price target of **\$432** (36.3% upside) over a one-year horizon. The market models Visa as a single-speed 10% compounder. I argue it is undergoing a silent business model transformation across three dimensions each of which is individually mispriced and collectively compounded to a terminal value materially stock price

I. The Market is Pricing the Wrong Geography

The market often treats Apple Pay, Google Pay, BNPL, crypto wallets, and AI commerce as threats to Visa, but most of them still rely on Visa's network to work. When someone uses Apple Pay or Google Pay, the transaction often still runs on a Visa card underneath, so Visa still earns a fee. The same idea applies to many newer players like PayPal, Klarna, Affirm, and even crypto off-ramps: they may control the customer interface, but they still depend on Visa's global acceptance, fraud protection, tokenization, and payment infrastructure.

A better way to think about these products is not as replacements for Visa, but as new channels built on top of Visa. Visa provides the underlying rails that let these services scale across millions of merchants and countries. So as new payment methods grow, Visa can still benefit because more of them end up using the same network underneath. The market may see innovation as taking volume away from Visa, but in many cases it actually expands Visa's reach.

II. The Incentive Problem is Hiding a Margin Expansion

Client incentives totalled \$15.75B in FY2025, reducing net revenue by over 20% before a single operating cost is recorded. In absolute terms these payments will continue to rise. The market often interprets this as a structural ceiling on Visa's economics. It is not. Visa pays issuing banks and merchants to issue and accept Visa cards. As more cards circulate, transaction volume increases, driving both Service Revenue and the incentive obligations tied to it. By contract, Service Revenue and client incentives scale together as payment volume grows, with incentives currently equal to ~91.1% of Service Revenue. Crucially, this linkage is contained mainly within the service side of the business. International Transaction Revenue (ITR) and Data Processing, which are expected to compound at 11.8% CAGR through FY2030, are not subject to the same incentive obligations. Visa retains these revenues in full. Visa separates service economics from network processing economics, and incentive payments sit exclusively within the service segment. As ITR and Data Processing grow from ~57% toward ~70% of net revenue by FY2030, the blended incentive intensity per revenue dollar structurally declines. This dynamic is already visible in reported results. In the most recent quarter, incentives grew 12% while gross revenue grew 15%, compressing the ratio of client incentives / revenue and allowing Visa to generate more net revenue per incentive dollar than the prior year. This showcases a change in the future revenue mix; allowing margins to continue to grow.

III. Operating Leverage on Fixed Visa-Net Infrastructure Shift & Incentive Compression

VisaNet is a ~70% fixed-cost asset at scale. Personnel is modelled at 6.0% annual growth (vs. 11% historical) due to news of layoff. Network & Processing at 5.71%, and normalised Professional Fees at 5.0% excluding MDL litigation escalation that distorts the historical rate to 17–19%. Total OpEx grows at ~7–8% vs. 10–11% revenue CAGR. EBIT margin expands from 68.3% (FY2025A) toward 70.6% (FY2030E) without catalytic assumptions. Each 100bps on \$67B FY2030 revenue = ~\$670M EBIT → ~\$535M NOPAT → ~\$10.7B terminal value at a 20x exit **\$5.60/share per 100bps**. This is not an assumption; it is arithmetic from building the P&L; bottom-up rather than extrapolating a flat margin.

Visa Inc. History

Visa traces its origins to Bank of America's BankAmericard program launched in 1958, the first large-scale open-loop credit card network. The system allowed multiple banks to issue cards accepted across a shared merchant network, creating the foundation for modern electronic payments. In the 1970s, regulatory pressure and the need for broader bank participation led BankAmericard to transition into a bank-owned association, later rebranded as Visa in 1976. Over the following decades Visa expanded globally as a payments network connecting consumers, merchants, and financial institutions. In 2008, Visa completed its IPO, raising \$17.9 billion, which at the time was the largest IPO in U.S. history.

Revenue Mix of Visa

How Client Incentives associated with Service Revenue

Segment	FY2021A	FY2025A	FY2030E	Obligation Type
Service Revenue (\$B)	\$11.5	\$17.1	\$19.9	
% of gross revenue	35%	31%	21% ↓

Total Incentives / Gross Rev.	25.8%	28.5%	27.6% ↓	
Explanation	—	—	Stable / slight ↓	Mix dilutes drag

Football Field Analysis

Catalysts

Post-COVID travel normalization, especially a continued recovery in cross-border and Asia-Pacific outbound corridors, can lift Visa's higher-yield international transaction revenues as travel mix keeps improving. Visa has continued to report strong cross-border growth, with cross-border volume excluding intra-Europe up 11% in fiscal Q4 2025, and management has pointed to broad-based strength across retail and travel; Visa's own APAC research also highlights Mainland China outbound travel as still normalizing rather than fully recovered.

AI Agentic Commerce & Visa-as-a-Service Expansion in which OpenAI, Microsoft, and Anthropic are embedding payment credentials directly into AI agents. Every agentic commerce transaction like autonomous subscriptions, AI-ordered goods, model-initiated B2B payments would clear on VisaNet and generates data-processing revenue at zero incremental distribution cost. Visa's 16B token infrastructure is already the credential layer of choice for AI wallet integrations. CNP volume from agentic sources is not in consensus estimates.

Competition, Visa vs Mastercard

Visa and Mastercard compete fiercely within their duopoly. Visa commands ~60% of global network volume versus Mastercard's ~35%, but Mastercard has grown faster, +84% vs +64% from 2020–2024; closing the gap through aggressive international expansion and faster build-out of value-added services.

Competition plays out primarily at the issuer level. Banks choose which network goes on their cards, and both companies spend heavily to win those relationships. Visa paid \$13.8B in client incentives in 2024, Mastercard \$13.0B. Co-brand deals with airlines, retailers, and fintechs are the highest-stakes battleground.

Mastercard has been more acquisitive, buying Recorded Future, Finicity, and Ekati to build its services layer. Both are racing to diversify beyond card rails before real-time payment networks erode their core interchange yet it doesn't change the fact that these two are the only firms in the market.

Network Effects – The Core Moat

Visa's value to every participant increases with every participant added. With 4.4B credentials accepted at 130M+ merchant locations in 200+ countries, the network is self-reinforcing. No merchant can ignore a card accepted everywhere; no bank can ignore a network every merchant accepts. This bilateral lock-in has compounded over 6 years and is structurally irreversible.

VisaNet- The Infrastructure Moat

VisaNet processes 65,000 transactions per second with 99.999%+ uptime. Replicating this infrastructure would require decades and tens of billions in capital. It is effectively a regulated utility with pricing power—no competitor has attempted to build at equivalent scale, and no government has been willing to fund a rival.

CUMULATIVE REVENUE GROWTH

MASTERCARD
+84.1%

2020 → 2024 growth

Risk Analysis and Sensitivity

- MDL Litigation**
\$899M provision Q4 FY2025. Total \$5–10B. Excluded from DCF. Bear case impact: –\$15–25/share on sentiment + capital return
- Mastercard Competitive Pressure**
If Mastercard captures incremental issuer wins or cross-border share, Visa could face weaker volume growth and higher client incentives to defend share.
- China Outbound Stays Depressed**
If China Outbound stays depressed, this is not too hindering to our overall model; Visa will face lower growth in ITR however this factor mainly acts as a catalyst.
- Consumer Slow Down**
Slower consumer spending would compress payment volume growth and cross-border mix, pressuring both service revenue and ITR. Bear case implies \$390–\$400/share (~7% downside).
